

SWISS PLATFORM FOR STRATEGIC
RAW MATERIALS AND ENERGY
SYSTEMS

Silent Energy AG

Strategic material availability.
Technical verification.
Clean transaction architecture.

Corporate profile for qualified new
contacts

Starting point

A Swiss stock corporation with a clear legal foundation and an industrial focus.

Silent Energy AG

The company is registered as an active Swiss stock corporation with its seat in Sarnen. Its statutory purpose covers energy systems, technology consulting, training and the worldwide granting of technology licences.

Today's orientation

Since its repositioning, the focus has been on combining strategic raw materials, high-purity materials, industrial testing pathways and qualified, protected execution routes.

Operating mode

Restrained externally, precise in qualification, consistent in source protection, compliance and traceability.

Why timing matters

Security of supply increasingly determines industrial capacity to act.

100%

US net import reliance for arsenic,
according to USGS 2026.

95%

Share of China/Hong Kong in US import
sources for arsenic metal, 2021–2024.

none

US government stockpile for arsenic,
according to USGS.

For critical applications, the real value does not lie in the material alone, but in documented origin, specification, availability, qualification and the ability to bring these elements into a clean transaction.

Source: USGS Mineral Commodity Summaries 2026, Arsenic.

Positioning

Silent Energy AG operates where material, technology and access converge.

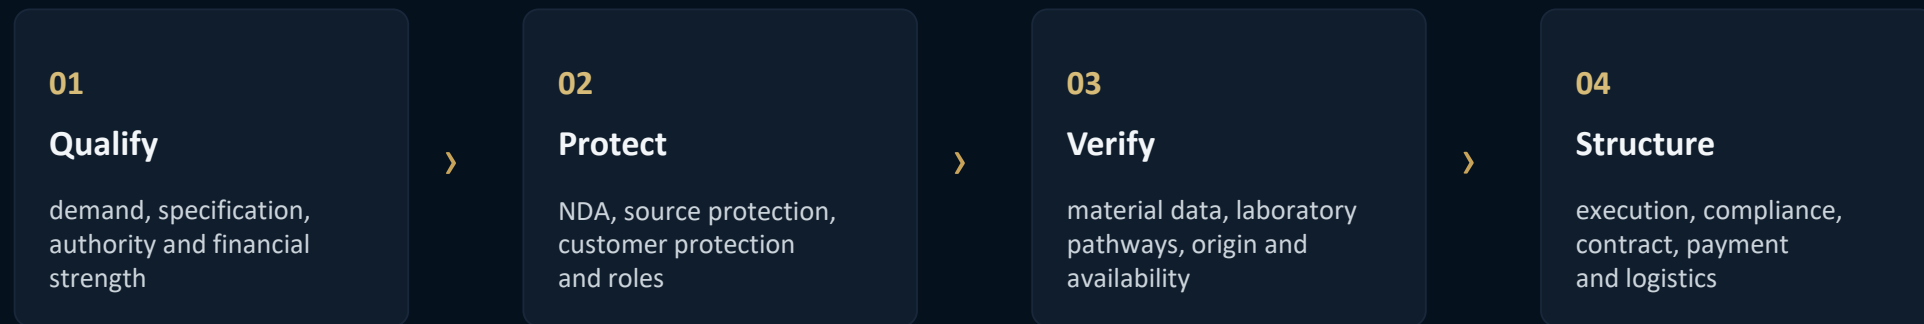

We do not see ourselves as an anonymous raw-material broker. Our contribution lies in structuring robust transactions: material positions, industrial sources, technical verification, clean customer protection and execution-ready counterparties must be brought together.

- high-purity specialty metals and precursors
- energy and technology licences in line with the company's statutory purpose
- project-specific transaction architecture
- qualification of industrial and institutional demand-side parties

Our operating model

Only when evidence, demand and protection are clear does a robust transaction emerge.

The objective is not the mere passing on of contacts, but a traceable, documented and verifiable process. Speed does not come from shortcuts, but from proper groundwork.

Current fields of work

Silent Energy AG's role is selective, not arbitrary.

- | | | |
|----|---------------------------|--|
| 01 | High-purity materials | strategic specialty metals, N6/N7 grades, documented material positions and industrial supply capability |
| 02 | Testing and specification | independent laboratory pathways, technical plausibility, quality, origin and suitability for target applications |
| 03 | Industrial application | semiconductors, optoelectronics, defense, specialty alloys as well as energy and project structures |
| 04 | Transaction architecture | customer protection, role clarification, compliance, contract structure and payment capacity |

Silent Energy AG only steps forward where protection, substance and transaction fit together.

Network and execution

Access alone is not enough. It must be protected, verified and made executable.

Silent Energy AG operates within a network of European production and testing structures, Swiss corporate and contractual architecture, US-aligned execution channels and industrial demand-side parties.

WHAT WE DO NOT DO

No price lists without qualification. No disclosure of sources without protection. No capital or advance-fee logic that burdens a transaction before it has been structured.

WHAT WE EXPECT

A documented demand-side party, technical specification, proof of mandate or representation, proof of funds and willingness to document the process properly.

CONVERSATIONS OF INTEREST TO US

Qualified transactions before contacts.

Suitable conversations are those with industrial users, strategic procurement parties, project sponsors, contractor structures and partners able to document a traceable demand seriously.

First step: demand situation, role clarification, protection agreement, thereafter technical and economic qualification.
